	Method 1	Method 2 (from Prajwal's code)	Method 2-1 (from E-mail)
Instrument response	Station XML to DISP		
Bandpass filter	1-15 Hz	2-15 Hz	
Low-sampling-rate data	1-9 Hz when Nyquist = 10 Hz		
P window	[P-0.5 s, P+0.5 s]		
P component	R, Z	Z only	
P amplitude	$\max\sqrt{R^2 + Z^2}$	|max(z) + min(Z)|	**max(z) – min(Z)**
S window	[S, S+2 s]	[S-1 s, S+1 s]	
S component	R, T, Z	R, T	
S amplitude	max(max|R|, max|T|, max|Z|)	max|R+T|	**$\max\sqrt{R^2 + T^2}$**
Noise window	[P-2.5 s, P-1 s]	[P-1.5 s, P-1 s] for P noise & [S-2 s, S-1 s] for S noise	
SNR threshold	P/S $\geq$ 3	Not specified	P/S $\geq$ 3 (applied for comparison only)
Output	$\log_{10}(S/P)$
